Thu, 06 Dec 2018 17:34:00 GMT VARIOUS NUMBER THEORISTS' HOMEPAGES/DEPARTMENTAL LISTINGS - In harmonic analysis and number theory, an automorphic form is a well-behaved function from a topological group G to the complex numbers (or complex vector space) which is invariant under the action of a discrete subgroup Γ , of the topological group. Automorphic forms are a generalization of the idea of periodic functions in Euclidean space to general topological groups. prime number (or a prime) is a natural number greater than 1 that cannot be formed by multiplying two smaller natural numbers. A natural number greater than 1 that is not prime is called a composite number. For example, 5 is prime because the only ways of writing it as a product, 1×5 or 5×1 , involve 5 itself. However, 6 is composite because it is the product of two numbers (2×3) that ... Prime number - Wikipedia -
